Received 8 October 2014; Revised 19 November 2014; Accepted 4 December 2014

Abstract. In this paper, we have studied fuzzy soft topological spaces. We introduce some new concepts in fuzzy soft topological spaces such as fuzzy soft first-countable space, fuzzy soft second-countable space, fuzzy soft Lindelöf spaces, and some basic properties of these spaces are explored.

2010 AMS Classification: 03E72, 08A72

Keywords: Fuzzy soft space, Fuzzy soft first-countable space, Fuzzy soft second-countable space, Fuzzy soft Lindelöf space.

1. Introduction

Many complicated problems arising in the fields of economics, sociology, engineering, environmental sciences, medical sciences etc. are highly dependent on the task of modelling uncertain data. When the uncertainty is highly complicated and difficult to characterize, classical mathematical approaches are found to be inadequate to derive effective or useful models. Zadeh [12] proposed the concept of fuzzy set theory in 1965, which has become a very important tool to solve such kinds of problems and provides an appropriate framework for representing vague concepts by allowing partial membership to the elements under consideration. Since then many applications of fuzzy set theory have been arisen in various fields of mathematics and computer sciences, such as fuzzy control systems, fuzzy automata, fuzzy logic and so on. Beside this theory, there are many theories like theory of probability, theory of intuitionistic fuzzy sets, theory of rough sets etc., which can be considered as mathematical tools for dealing with uncertainties. But all these theories have their own limitations and difficulties. For example, the theory of probability can deal only with possibility, and in fuzzy set theory, the difficulty of setting the appropriate membership function in each particular case. Intuitionistic fuzzy set theory is more generalized concept than fuzzy set theory, but this theory has the same difficulty.
In 1999, the Russian researcher Molodtsov [7] pointed out that the reason for these difficulties was, possibly, the inadequacy of the parametrization tool of the theory, and he proposed the concept of soft set theory for dealing with uncertainties. Soft set theory is free from the difficulties mentioned above. In his paper, Molodtsov pointed out several directions for the applications of soft sets, such as game theory, Riemann integration, theory of measurement, smoothness of functions and so on. In 2003, Maji et al. [6] studied the theory of soft sets initiated by Molodtsov. They defined and studied several basic notions of soft sets with examples.

In recent times, many researchers have contributed a lot towards fuzzification of Soft Set Theory. Maji et al. [5] introduced the concept of fuzzy soft set. He defined fuzzy soft union, intersection, complement of fuzzy soft set, De Morgan Law etc. Then many researcher have applied this concept on group theory [1], decision making problems [3], relations [9] etc. In 2011, Tanay et al. [10] initially gave the concept of fuzzy soft topology using the fuzzy soft sets and gave the basic notions of it by following Chang [2]. Pazar Varol and Aygun [11] defined fuzzy soft topology in Lowen’s sense. Further, many other concepts of fuzzy soft topology such as hausdorffness, compactness, connectedness, separation axioms etc. have been studied by researchers.

In this paper, we introduce some new concepts in fuzzy soft topological spaces such as fuzzy soft first-countable space, fuzzy soft second countable space and fuzzy soft Lindel"{o}f space, and some properties and relations in these spaces are discussed.

2. Preliminaries

Throughout this paper, $X$ refers to an initial universe, $E$ is the set of all parameters for $X$.

**Definition 2.1** ([12]). A fuzzy set $A$ of non-empty set $X$ is characterized by a membership function $\mu_A$ which associates each point of $X$ to a real number in the interval $[0, 1]$, with the value $\mu_A(x)$ at $x$ representing the “grade of membership” of $x$ in $A$.

**Definition 2.2** ([12]).

1. Fuzzy sets $A$ and $B$ are said to be equal, written as $A = B$, if and only if $\mu_A(x) = \mu_B(x)$ for all $x \in X$.

2. Fuzzy set $A$ is contained in a fuzzy set $B$ if and only if $\mu_A(x) \leq \mu_B(x)$ for all $x \in X$.

3. The union of two fuzzy sets $A$ and $B$ with respective membership functions $\mu_A$ and $\mu_B$ is a fuzzy set $C$, written as $C = A \cup B$ whose membership function is related to those of $A$ and $B$ is given by $\mu_C(x) = \max \{\mu_A(x), \mu_B(x)\}$ for all $x \in X$.

4. The intersection of two fuzzy sets $A$ and $B$ with respective membership functions $\mu_A$ and $\mu_B$ is a fuzzy set $C$, written as $C = A \cap B$ whose membership function is related to those of $A$ and $B$ is given by $\mu_C(x) = \min \{\mu_A(x), \mu_B(x)\}$ for all $x \in X$.

5. Let $\Omega$ be an index set and $\{f_i : i \in \Omega\}$ be the family of fuzzy sets in $X$. Then their union $\bigcup_{i \in \Omega} f_i$ and intersection $\bigcap_{i \in \Omega} f_i$ are defined, respectively as follows:

   (i) $(\bigcup_{i \in \Omega} f_i)(x) = \sup \{f_i(x) : i \in \Omega\}$, $\forall x \in X$,
The fuzzy soft intersection of the universal fuzzy soft set $A$ is defined as follows:

$$
\bigcap_{i \in \Omega} f_i(x) = \inf \{ f_i(x) : i \in \Omega \}, \forall x \in X.
$$

From here onwards, $A$ denotes the subset of the parameters set $E$.

**Definition 2.3** Let $X$ be a common universe and $\tau$ be its family of fuzzy soft sets. The fuzzy soft intersection of $\tau$ is defined by

$$
\bigcap \tau = \{ (e, A) : (e, A) \in \tau \}, \forall e \in E.
$$

**Definition 2.4** Let $X$ be a common universe and $\tau$ be its family of fuzzy soft sets. The union of any number of fuzzy soft sets in $\tau$ is defined by

$$
\bigcup \tau = \{ (e, A) : (e, A) \in \tau \}, \forall e \in E.
$$

**Definition 2.5** For two fuzzy soft sets $f_A$ and $g_B$ over a common universe $X$, $f_A$ is said to be fuzzy soft subset of $g_B$, denoted by $f_A \subseteq g_B$, if $f_A(e) \subseteq g_B(e)$, $\forall e \in E$.

**Definition 2.6** Two fuzzy soft sets $f_A$ and $g_B$ over a common universe $X$ are said to be fuzzy soft equal if $f_A \subseteq g_B$ and $g_B \subseteq f_A$.

**Definition 2.7** The complement of a fuzzy soft set $f_A$, denoted by $f_A^c$, is the fuzzy soft set over $X$ defined by $f_A^c(e) = 1_X - f_A(e)$, $\forall e \in E$, where $1_X$ denotes the null fuzzy set in $X$ given by $1_X(x) = 1$, $\forall x \in X$.

**Definition 2.8** The universal fuzzy soft set $1_E$ over $X$ is given by $1_E(e) = 1_X$, $\forall e \in E$ and the null fuzzy soft set $0_E$ over $X$ is given by $0_E(e) = 0_X$, $\forall e \in E$.

Clearly, we have $1_E^c = 0_E$ and $0_E^c = 1_E$.

**Definition 2.9** The fuzzy soft union of $f_A$ and $g_B$, denoted by $f_A \cup g_B$, is the fuzzy soft set over $X$ defined by $(f_A \cup g_B)(e) = f_A(e) \cup g_B(e)$, $\forall e \in E$.

**Definition 2.10** The fuzzy soft intersection of $f_A$ and $g_B$, denoted by $f_A \cap g_B$, is the fuzzy soft set over $X$ defined by $(f_A \cap g_B)(e) = f_A(e) \cap g_B(e)$, $\forall e \in E$.

**Definition 2.11** Let $\Omega$ be an index set and $\{ (f_A)_i : i \in \Omega \}$ be a family of fuzzy soft sets over $X$. Then their union $\bigcup_{i \in \Omega} (f_A)_i$ and intersection $\bigcap_{i \in \Omega} (f_A)_i$ are defined, respectively as follows:

1. $\bigcup_{i \in \Omega} (f_A)_i(e) = \bigcup_{i \in \Omega} (f_A)_i(e), \forall e \in E$,
2. $\bigcap_{i \in \Omega} (f_A)_i(e) = \bigcap_{i \in \Omega} (f_A)_i(e), \forall e \in E$.

**Definition 2.12** A fuzzy soft topological space is a pair $(X, \tau)$ consisting of a non-empty set $X$ and a family $\tau$ of fuzzy soft sets over $X$ satisfying the following conditions:

1. $0_E, 1_E$ belong to $\tau$,
2. The union of any number of fuzzy soft sets in $\tau$ belongs to $\tau$,
3. The intersection of any two fuzzy soft sets in $\tau$ belongs to $\tau$.

Then $\tau$ is called a fuzzy soft topology over $X$. Members of $\tau$ are called fuzzy soft open sets. A fuzzy soft set $f_A$ over $X$ is called fuzzy soft closed set if $f_A^c \in \tau$. 

837
A fuzzy soft topological space is called indiscrete if its topology contains only \(0_E\) and \(1_E\), while the topology of the discrete fuzzy soft topological space consists of all fuzzy soft sets over \(X\).

**Definition 2.13** ([8]). A fuzzy soft topological space is called indiscrete if its topology contains only \(0_E\) and \(1_E\), while the topology of the discrete fuzzy soft topological space consists of all fuzzy soft sets over \(X\).

**Definition 2.14** ([8]). A fuzzy soft set \(g_B\) over a fuzzy soft topological space \((X, \tau)\) is called a fuzzy soft neighbourhood of the fuzzy soft set \(f_A\) if there exist a fuzzy soft open set \(h_C\) such that \(f_A \subseteq h_C \subseteq g_B\).

**Definition 2.15** ([8]). Let \((X, \tau)\) be a fuzzy soft topological space and let \(f_A\) be a fuzzy soft open set over \(X\). Then

1. The fuzzy soft closure of \(f_A\) is defined as the intersection of all fuzzy soft closed sets which contain \(f_A\) and is denoted by \(\overline{f_A}\). We write \(\overline{f_A} = \cap\{g_B : g_B\) is fuzzy soft closed and \(f_A \subseteq g_B\}\).

2. The fuzzy soft interior of \(f_A\) is defined as the union of all fuzzy soft open sets contained in \(f_A\) and is denoted by \(f^0_A\). We write \(f^0_A = \cup\{g_B : g_B\) is fuzzy soft open and \(g_B \subseteq f_A\}\).

**Definition 2.16** ([11]). A fuzzy soft set \(f_A\) is said to be a fuzzy soft point, denoted by \(e(f_A)\), if for the element \(e \in A\), \(f_A(e) \neq 0_X\) and for \(e \neq e' \in A\), \(f_A(e') = 0_X\).

**Theorem 2.17** ([11]). Let \((X, \tau)\) be a fuzzy soft topological space. A fuzzy soft point \(e(f_A) \in \overline{f_A}\) if and only if each fuzzy soft neighbourhood of \(e(f_A)\) intersects \(g_B\).

**Definition 2.18** ([11]). Let \(\mathcal{F}(X, E)\) and \(\mathcal{F}(Y, K)\) be the families of fuzzy soft sets over \(X\) and \(Y\) respectively and \(E, K\) be the parameters sets for the universe \(X\) and \(Y\) respectively. Let \(u : X \rightarrow Y\) and \(p : E \rightarrow K\) be mappings. Then the fuzzy soft mapping \((u, p) : \mathcal{F}(X, E) \rightarrow \mathcal{F}(Y, K)\) is defined as:

1. Let \(f_A\) be a fuzzy soft set in \(\mathcal{F}(X, E)\). Then the image of \(f_A\) under \((u, p)\), written as \((u, p)f_A\), is a fuzzy soft set in \(\mathcal{F}(Y, K)\) such that

\[
(u, p)f_A(k)(y) = \begin{cases} 
\sup_{x \in u^{-1}(y)} \sup_{e \in u^{-1}(k)} f_A(e)(x), & \text{if } p^{-1}(y) \neq \phi, u^{-1}(k) \neq \phi, \\
0, & \text{otherwise,}
\end{cases}
\]

for \(\forall y \in Y\) and \(\forall k \in K\).

2. Let \(g_B\) be a fuzzy soft set in \(\mathcal{F}(Y, K)\). The inverse image of \(g_B\) under \((u, p)\), written as \((u, p)^{-1}(g_B)\) is a fuzzy soft set in \(\mathcal{F}(X, E)\) such that

\[
(u, p)^{-1}g_B(e)(x) = g_B(u(e))(p(x)), \forall x \in X \text{ and } \forall e \in E.
\]

3. **Fuzzy soft first and second-countable spaces**

**Definition 3.1** ([11]). Let \((X, \tau)\) be a fuzzy soft topological space and \(\mathcal{B}\) be a subfamily of \(\tau\). If every element of \(\tau\) can be written as the arbitrary fuzzy soft union of some elements of \(\mathcal{B}\), then \(\mathcal{B}\) is called a fuzzy soft basis for the fuzzy soft topology \(\tau\).

**Definition 3.2** ([11]). Let \((X, \tau)\) be a fuzzy soft topological space. Then a subfamily \(\mathcal{S}\) of \(\tau\) is called a subbase for \(\tau\) if every member of \(\tau\) is a union of finite intersections of members of \(\mathcal{S}\).
Definition 3.3 ([10]). Let $(X, \tau)$ be a fuzzy soft topological space and $f_A \in \mathcal{F}(X, E)$, then the topology $\tau'$ defined by $\tau' = \{f_A \cap g_B : g_B \in \tau\}$ is a fuzzy soft topology on the fuzzy soft subset $f_A$ and called the fuzzy soft subspace topology. With respect to this topology, $(f_A, \tau')$ is called fuzzy soft subspace of $(X, \tau)$.

Definition 3.4 ([10]). Let $(X, \tau)$ be a fuzzy soft topological space, $\mathcal{B}$ be a fuzzy soft basis for $(X, \tau)$ and $f_A \in \mathcal{F}(X, E)$. Then the collection $\mathcal{B}' = \{f_A \cap g_B : g_B \in \mathcal{B}\}$ is a fuzzy soft basis for the fuzzy soft subspace topology $(f_A, \tau')$.

Definition 3.5. Let $(X, \tau)$ be a fuzzy soft topological space, and let $\mathcal{U}$ be a family of fuzzy soft neighbourhoods of some fuzzy soft point $e(f_A)$ in $X$. If for each fuzzy soft neighbourhood $g_B$ of $e(f_A)$, there exists $h_C$ in $\mathcal{U}$ such that $e(f_A) \in h_C \subseteq g_B$ then we say that $U$ is a fuzzy soft neighbourhood base at $e(f_A)$.

Definition 3.6. Let $(X, \tau)$ be a fuzzy soft topological space, and let $e(f_A)$ be a fuzzy soft point in $X$. If $e(f_A)$ has a countable fuzzy soft neighbourhood base, then we say that $(X, \tau)$ is fuzzy soft first-countable at the fuzzy soft point $e(f_A)$. If $(X, \tau)$ is fuzzy soft first-countable at each of its fuzzy soft points, then we say that $(X, \tau)$ is fuzzy soft first-countable.

Even nicer than first-countable fuzzy soft spaces are the second-countable fuzzy soft spaces, in which we can describe all the fuzzy soft open sets in terms of a countable subcollection of fuzzy soft sets.

Definition 3.7. A fuzzy soft topological space $(X, \tau)$ is fuzzy soft second-countable if it has a countable fuzzy soft base $\mathcal{B}$ for its topology $\tau$, say $\mathcal{B} = \{(f_A)_1, (f_A)_2, (f_A)_3, \ldots\}$. That is, given any open set $f_A$ and point $e(g_B) \in f_A$, there is $(f_A)_n \in \mathcal{B}$ such that $(f_A)_n \subseteq f_A$ with $e(g_B) \in (f_A)_n$.

Proposition 3.8. Each fuzzy soft second-countable space is fuzzy soft first-countable.

Proof. Let $(X, \tau)$ be a fuzzy soft second-countable space and suppose $\mathcal{B} = \{(f_A)_1, (f_A)_2, (f_A)_3, \ldots\}$ be the countable fuzzy soft base. We can take for a fuzzy soft basis at $e(f_A)$ the sequence of all $(f_A)_n$ which contain $e(f_A)$, call this collection as $\mathcal{B}'$. Then $\mathcal{B}'$ is countable as it is fuzzy soft subset of the countable fuzzy soft base $\mathcal{B}$, and since $\mathcal{B}$ is fuzzy soft basis, for any fuzzy soft neighbourhood $g_B$ of $e(f_A)$, there exists $(f_A)_n \in \mathcal{B}'$ such that $e(g_B) \in (f_A)_n \subseteq g_B$. This implies that $(X, \tau)$ is fuzzy soft first-countable.

Proposition 3.9. A subspace of fuzzy soft first-countable space is fuzzy soft first-countable and same holds for second-countability.

Proof. We prove for second countability and first follows from second. Let $(X, \tau)$ is a fuzzy soft second-countable space and $(f_A, \tau')$ be a fuzzy soft subspace of $(X, \tau)$. Suppose $\mathcal{B} = \{(f_A)_1, (f_A)_2, (f_A)_3, \ldots\}$ is a countable fuzzy soft basis for the space $(X, \tau)$. Then take the basis for subspace $(f_A, \tau')$ as $\mathcal{B}' = \{f_A \cap g_B : g_B \in \mathcal{B}\}$, which is countable. Therefore $(f_A, \tau')$ is fuzzy soft second-countable.

Remark 3.10. There exists a fuzzy soft space which is not fuzzy soft first-countable.

Remark 3.11. There exists a fuzzy soft first-countable space which is not fuzzy soft second-countable.
Example 3.12. (1) Let \( X \) be an uncountable set, and \( A = \{e\} \). Let \( \tau = \{f_A : f_A(e) = 1_X - g_A(e), g_A(e) \) is finite fuzzy set in \( X \}, \) then \((X, \tau)\) is a fuzzy soft topological space, which is not fuzzy soft first-countable.

(2) If we take the discrete fuzzy soft topology \( \tau^1 \) on \( X \), over the parameter set \( E \), then each fuzzy soft set in \( X \) is open with respect to discrete fuzzy soft topology. Take \( B_{\epsilon}(f_A) = \{\epsilon(f_A)\} \) as fuzzy soft neighborhood base at each fuzzy soft point \( \epsilon(f_A) \). Then \( B_{\epsilon}(f_A) \) is countable and for each fuzzy soft neighborhood \( g_B \) of \( \epsilon(f_A) \), there is always \( \{\epsilon(f_A)\} \in B_{\epsilon}(f_A) \) such that \( \epsilon(f_A) \in \{\epsilon(f_A)\} \subseteq g_B \). Therefore \((X, \tau^1)\) is fuzzy soft first-countable space but it is not fuzzy soft second-countable space.

Theorem 3.13. (1) Product of countably many fuzzy soft-first-countable spaces is fuzzy soft first-countable space.

(2) Product of countably many fuzzy soft-second-countable spaces is fuzzy soft second-countable space.

Proof. We prove only for second-countability and first follows from the second. For each \( n \in \mathbb{N} \), let \((X_n, \tau_n)\) be the countable fuzzy soft second-countable space over the parameter set \( E_n \). And let \( B_n \) be the countable fuzzy soft base for the fuzzy soft topological space \( X_n \). Put \( B = \big\{ \prod_{n \in \mathbb{N}} (f_A)_n : (f_A)_n \in B_n \text{ and } (f_A)_n \text{ equals } 1_{E_n} \text{ except for finitely many values of } n \big\} \). Then \( B \) is countable and a fuzzy soft base for \( \prod_{n \in \mathbb{N}} (X_n, \tau_n) \). \( \square \)

Theorem 3.14. The image of fuzzy soft first-countable spaces under a fuzzy soft open continuous map are fuzzy soft first-countable.

Proof. Let \((X, \tau_1)\) and \((Y, \tau_2)\) be two fuzzy soft spaces over the parameter set \( E \), and suppose \((X, \tau_1)\) is fuzzy soft first-countable, and let \((u, p)\) be an onto fuzzy soft continuous open mapping from \((X, \tau_1)\) to \((Y, \tau_2)\). Since \((u, p)\) is onto, for any fuzzy soft point \( \epsilon(g_B) \) in \( Y \), there exists a fuzzy soft point \( \epsilon(f_A) \) in \( X \) such that \((u, p)(\epsilon(f_A)) = \epsilon(g_B)\). Since \((X, \tau_1)\) is fuzzy soft first-countable, there exists a countable fuzzy soft neighborhood base \( \{(f_A)_n\}_{n \in \mathbb{N}} \) at \( \epsilon(f_A) \). Then it is easy to see that \( \{(u, p)((f_A)_n)\}_{n \in \mathbb{N}} \) is fuzzy soft neighborhood base at \( \epsilon(g_B) \). \( \square \)

Definition 3.15. A fuzzy soft space \((X, \tau)\) is fuzzy soft Lindelöf if each fuzzy soft open covering \( A \) of \( X \) has a countable subcover.

Proposition 3.16. Each fuzzy soft second-countable space is fuzzy soft Lindelöf.

Proof. Let \((X, \tau)\) be a fuzzy soft second-countable space, and let \( B \) be a countable fuzzy soft open base of \( X \). Let \( C \) be an arbitrary fuzzy soft open covering of \( X \). Put \( B' = \{ f_A \in B : \text{there is } g_B \in C \text{ such that } f_A \subseteq g_B \} \). Then \( B' \) is countable. Denote \( B' \) by \( \{(f_A)_n : n \in \mathbb{N}\} \). For each \( n \in \mathbb{N} \), there exists an \((h_A)_n \in C \) such that \((f_A)_n \subseteq (h_A)_n \). Then \( \{(h_A)_n : n \in \mathbb{N}\} \) is countable fuzzy soft subfamily of \( C \). Next we shall prove that \( \{(h_A)_n : n \in \mathbb{N}\} \) is a fuzzy soft cover of \((X, \tau)\).

Take an arbitrary fuzzy soft point \( \epsilon(f_A) \) in \( F(X, E) \). Since \( C \) is a fuzzy soft covering of \( X \), there exists a \( C \in C \) such that \( \epsilon(f_A) \in C \). Since \( C \) is open fuzzy soft set, so
Each fuzzy soft regular and fuzzy soft second-countable space is normal.

Definition 3.17. Let \((X, \tau)\) be a fuzzy soft topological space over the set of parameter \(E\). Let \(gB\) be a fuzzy soft closed set over \((X, \tau)\) and a fuzzy soft point \(e\in B\). If there exist fuzzy soft open sets \((fA)1\) and \((fA)2\) such that \(e\in (fA)1\), \(gB\subseteq (fA)2\) and \((fA)1\cap (fA)2 = \emptyset\), then \((X, \tau)\) is called a fuzzy soft regular space.

Definition 3.18. Let \((X, \tau)\) be a fuzzy soft topological space over \(X\), and let \((gB)1\) and \((gB)2\) be two disjoint fuzzy soft closed sets over \(X\). If there exist fuzzy soft open sets \((fA)1\) and \((fA)2\) such that \((gB)1\subseteq (fA)1\), \((gB)2\subseteq (fA)2\) and \((fA)1\cap (fA)2 = \emptyset\), then \((X, \tau)\) is called a fuzzy soft normal space.

Theorem 3.19. Each fuzzy soft regular and fuzzy soft Lindelöf space is fuzzy soft normal.

Proof. Let \((X, \tau)\) be a fuzzy soft regular and fuzzy soft Lindelöf space. Let \((fA)1\) and \((fA)2\) be two disjoint fuzzy soft closed sets over \(X\). For each fuzzy soft point \(e\in B\) of \((fA)1\) such that \(e\in (fA)1\), let \(\mathcal{G} = \{gB : e\in (fA)1\}\) i.e., \(\mathcal{G}\) is the collection of fuzzy soft open neighbourhoods of \(e\). Since \((X, \tau)\) is a fuzzy soft Lindelöf, there exists a countable subcover \(\{n\in \mathbb{N}\}\) of \(\mathcal{G}\). Put \(G_n = \{gB\text{ for each }n\in \mathbb{N}\}\), then \(\mathcal{G}\cup\{G_n\}\) is a fuzzy soft open cover of \(X\). Since \((X, \tau)\) is a fuzzy soft Lindelöf, there exists a countable subcover \(\{G_n\}\) of \(\mathcal{G}\) such that \(G_n\cap \{G_n\} = \emptyset\). Similarly, there exist countably many fuzzy soft open sets \(\{F_n\}\) such that \(\mathcal{G}\cup\{G_n\}\) is a fuzzy soft normal.

For each \(n\in \mathbb{N}\), put

\[
G'_n = G_n \cup \left(\bigcup_{m=1}^n F_m\right)^c, \quad F'_n = F_n \cup \left(\bigcup_{m=1}^n G_m\right)^c.
\]

Then for \(m, n\in \mathbb{N}\), we have \(G'_n \cap F'_m = \emptyset\). Put

\[
G = \bigcup_{n\in \mathbb{N}} G'_n, \quad F = \bigcup_{n\in \mathbb{N}} F'_n.
\]

Then we have \((fA)1\subseteq G\), \((fA)2\subseteq F\), and \(G\cap F = \emptyset\). Therefore, \((X, \tau)\) is fuzzy soft normal.

Corollary 3.20. Each fuzzy soft regular and fuzzy soft second-countable space is fuzzy soft normal.

Definition 3.21 ([9]). Let \((X, \tau)\) be a fuzzy soft topological space, where \(\tau = \{(fA)\}, \lambda \in \delta\). Then the collection \(\tau_{ei} = \{(fA)\} \cup \{e_i\}\), for each \(e_i \in E\), defines a fuzzy topology on \(X\). This fuzzy topology is called the \(e_i\)-parameter topology.

Proposition 3.22. Let \((X, \tau)\) be a fuzzy soft topological space over the parameter set \(E\). If we take \(E = \{e\}\). Then \((X, \tau)\) is fuzzy soft Lindelöf if and only if the fuzzy topological space \((X, \tau_e)\) is fuzzy Lindelöf.
4. Conclusions

In the present work, we have presented some concepts such as fuzzy soft first-countable space, fuzzy soft second-countable space and fuzzy soft Lindelöf space. Moreover, we have established several useful results and its fundamental properties in detail with the help of some examples. We hope that the concepts and results discussed in this manuscript will certainly help researcher to enhance and promote the further study on fuzzy soft topology to carry out a general framework for their applications in practical life.
